

## DG-1000 Simulator

Version: **DG1000ConnectInstaller1.2.0.21.exe**

### *The software*

The DG-1000 Connect software can simulate or mimic the user interface of the DG-1000 Pressure Gauge on a computer screen and it can also be projected onto a screen via a projector. The software is a training and distribution tool provided by our manufacturer TEC.

### *How does the software works?*

You can control all functions and modes of the DG-1000 virtual, displayed on your computer screen. As a result, various applications with the BlowerDoor, the MiniFan, the MLM, etc. can be shown via TeamViewer, projector or computer.

### What does the software do?

After opening the app "Gauge" on the virtual DG-1000, the user has the choice:

- to show a DG-1000 simulator (emulator),
- to control a real DG-1000 gauge connected to the computer
- or even to control a real DG-700 connected to the computer (Wi-Fi or USB cable) via the virtual DG-1000 surface on the computer

When a "real" gauge (DG-1000 or DG-700) is selected, the program also displays the actual readings that the units are measuring. By connecting to a DG-700, a customer has the opportunity to directly experience the advantages of our DG-1000 during operation. Just like the real DG-1000, language options are available from the DG-1000's Settings menu (scroll down). Likewise, measuring devices such as the BlowerDoor Standard, the MiniFan, the MLM etc. can be controlled via the program, for example with cruise control.
